Core Technologies:

- TypeScript
- React
- NodeJS
- Next.js
- Python
- Postgres
- GraphQL
- Tailwind
- Zustand
- NestJS
- Firebase
- MongoDB

Others:

- Agentic Frameworks
- Voice AI Pipelines
- STT/LLM/TTS Latency
- Evals & Observability
- Workflow Orchestration
- Real-time Systems
- Marketplace Systems
- Design Systems
- Micro-Frontend Architecture
- Accessibility (AA)
- 0 to 1 Product
- Engineering Leadership

Arvind Ram Singh Kishore

Principal Engineer, Mercor. Founder. AI Product Engineer.

I build and scale AI products at companies that compound fast. Founding engineer at Vapi from Series A to a \$500M+ valuation; now Principal Engineer at Mercor, leading the Talent Experience Platform through the fastest revenue ramp in software history. Ex-founder. I ship production agents on both ends of the spectrum — real-time voice at consumer scale, and enterprise agents inside regulated workflows.

Experience

8 years building and scaling products, across founder, founding engineer, and engineering leadership roles:

Mercor — Principal Engineer

2026 - Present

Leading the Talent Experience Platform team at the fastest-growing company in history — \$1M to \$2B ARR in 24 months, \$10B valuation.

- Lead the Talent Experience Platform: the surface through which a 300,000+ expert network is matched, onboarded, evaluated, and paid
- Own systems supporting \$2M+ in daily contractor payouts across 30,000+ weekly active experts
- Build enterprise agent workflows for the AI labs and Fortune-scale customers Mercor serves, including OpenAI, Anthropic, and Meta
- Drive architecture decisions for a platform scaling through a revenue ramp with no precedent in software
- Partner directly with founders and product leadership on roadmap and technical strategy

Vapi — Founding Lead Product Engineer

March 2025 - 2026

Joined at Series A and helped scale Vapi to a \$500M+ valuation, 1B+ calls, and 1M+ developers as voice AI went mainstream.

- Owned the product surface through 10x enterprise revenue growth and a \$130M to \$500M+ valuation run
- Led end-to-end design and development of Vapi's real-time dashboard using React, TypeScript, Zustand, and Tailwind CSS
- Built Vapi Workflows, the orchestration builder for multi-step voice agents, with per-call overrides, bulk editing, and live debugging
- Led architecture and implementation of the Evaluations (Evals) engine for testing agent behavior before production
- Shipped live transcript visualization with animated node traversal, making multi-step agent runs debuggable
- Rebuilt logging and observability with component-level tracing across STT/LLM/TTS pipelines
- Contributed to core voice pipeline reliability: advanced voice activity detection, adaptive endpointing, and streaming speech-recognition filters that cut false interruptions
- Redesigned dashboard architecture for reliability and performance, reducing page load times by 30%
- Implemented flexible data exports via webhooks and S3, improving production monitoring and incident resolution
- Platform served customers including Amazon Ring, Intuit, New York Life, and ServiceTitan

AsynchRetro — Founder

2020 - 2024

Founded and ran an opinionated async retrospective tool for distributed agile teams. Built and operated solo alongside full-time engineering roles; sunset in 2024.

- Designed an opinionated 4-step retrospective flow — comments, grouping, voting, discussion — that ran fully asynchronously across time zones
- Built the complete SaaS: authentication, team and organization management, granular board permissions, and guest access
- Shipped Stripe subscription billing end-to-end with free trials, annual plans, coupon codes, and win-back offers
- Implemented real-time multi-user collaboration on Firebase with anonymity controls, vote limits, and per-team board configuration
- Built on the MERN stack over Google Cloud Platform, shipped and operated as a single engineer

CapConnect+ Inc — Director of Engineering

May 2024 - March 2025

Led engineering for a digital marketplace serving fixed income primary markets.

- Built a digital marketplace reducing corporate paper issuance time by 30%
- Increased platform adoption by 50% within a year through UX improvements
- Improved operational transparency and efficiency for issuers, dealers, and investors
- Contributed to 25% year-over-year growth in platform revenue

Suno Inc — Engineering Manager

October 2023 - May 2024

Led development of an AI-driven audiology software platform for healthcare providers.

- Developed an AI-driven platform streamlining patient management for audiologists
- Spearheaded integration of real-time analytics and generative AI features
- Achieved 30% increase in patient engagement through intelligent automation
- Reduced administrative tasks by 25% for healthcare providers

HavenTech — Team Lead, Senior Software Engineer

October 2021 - October 2023

Led the design system team building accessible experiences for over a million users.

- Led a high-performing team building the Haven Design System (HDS) in React and TypeScript
- Implemented a scalable micro-frontend architecture in Storybook
- Componentized HTML elements to meet AA accessibility standards and RFC compliance
- Transitioned the JavaScript codebase to a scalable TypeScript platform
- Improved accessibility and performance metrics via Google Lighthouse integration
- Started and led internal developer communities: FrontEnd Learning Talks and Performance Thursdays

Vistaprint — Senior Software Engineer

November 2018 - October 2021

Built tools and services helping small businesses expand their online presence.

- Migrated over 2 million users from the legacy site builder to the flagship website builder, and led the eventual sunset of the legacy platform
- Designed database verification and data model mapping scripts to migrate without customer-facing disruption
- Built revamped dashboards for domain management, email hosting, and customer statistics using Gatsby and GraphQL
- Implemented localized URL routing across 26 languages and 22 locales

Open Source & Projects

Author of [extract-design-system](#), an AI agent skill with **126K+ installs** across Claude, Cursor and Codex that reverse-engineers design tokens from any public website.

I ship agents in the open on [GitHub](#) — including [ycagent.ai](#) (deep-research agent over the Y Combinator ecosystem), deep-research-agents (background agents with pgvector semantic search), computer-use-agent (multimodal agent driving a live Linux VM), and slack-agent (durable stateful agent infrastructure).

Hackathon judge at the **Y Combinator AI Agent Hackathon** (2025). I write about production AI engineering at [blog.arvindrk.com](https://arvindrk.com).
